Important Camera-Collar Information
for cameras produced Aug. 2020

How to connect the camera to the PC

Remove the metal cap from the camera pack and connect the camera cable (4 pins!) to your PC.

NOTE: The cable for the camera differs from the VERTEX USB cable (8 pins!) you use to connect the collars electronics to the PC!

After the connection is established, the camera pops up as a USB drive and you can start downloading the videos. You do not need any extra software for it.

Please be careful to not accidentally delete all videos. Make sure to use the function „safely remove hardware and eject media" when disconnecting the camera from your PC!

Programming the camera settings

The camera settings can be programmed through the electronics using GPS PLUS X, by removing the metal cap from the electronics housing and plug in the VERTEX USB cable (8 pins!). After connecting the USB cable to your PC, open GPS PLUS X and choose the setting you want to change.

NOTE: Please do not change the camera schedule yourself without checking with VECTRONIC first. Camera Commands cannot be send remotely via iridium, and current model requires factory scheduling of camera.

Sending back camera collars

In case you want to be on the safe side or you want us to refurbish your collars anyway, you can of course send them to us. Please make sure that you send us the electronics AND the camera pack back. To make data handling easier please include your own external Hard Drive in your package to VAS, otherwise you can buy one from VAS.
